

Short Question # 1

- What is ALU?
- It performs arithmetic and logical operations on data. ALU performs arithmetic operations like addition, subtraction, multiplication, and division. ALU also performs logical operations by comparing numerical data as well as alphabetic data. For example, it checks whether first number is greater than second, less than second or equal to second, etc.

Short Question # 2

- What is modem? Also name its types.
- Modem stands for modulator and demodulator. It is a commonly used communication device that converts digital signals into analog signals and vice versa. It is used to send and receive data between two computers through the telephone line. Both sending and receiving computers must have modems.
- Types: There are three types of modems: cable, digital subscriber line (DSL) and dial-up.

Short Question # 3

- Differentiate between database and database management system.
- A database is an organized collection of data, generally stored and accessed electronically from a computer system. Where databases are more complex they are often developed using formal design and modeling techniques.
- Database Management Systems (DBMS) refer to the technology solution used to optimize and manage the storage and retrieval of data from databases. DBMS offers a systematic approach to manage databases via an interface for users as well as workloads accessing the databases via apps.
