

## **Computer Important question and answers.**

**1: Flash memory** is a kind of memory that retains data in the absence of power supply.

“the diagnostics are kept in flash memory”.

**2: Impact printer** forms characters or images by striking mechanism such as printer hammer or wheel against an linked ribbon, leaving an image on the paper.

Types of impact printers: Dot matrix, Daisy-wheel and line printer.

**Non-Impact printer:** Non-impact printers forms character or images without making direct physical contact between printing mechanism or paper.

Types of non-impact printers: Laser, inkjet and thermal printers.

**3:Touch pad:** The touch pad is small, flat surface over which we slide our fingers, using the same movements as we would with a mouse. Touch pads are now common on the portable computers (laptops).

**4: Biometric input devices** are used to capture this data and convert it into a digital format that can be used by computers.

**5: Package software**: This software is the kind off-the-shelf programs or components, developed for sale to the potential software developers/users for their use. MS Word and MS Power point are example of package software.

**6: Computer memory** is a temporary storage space in which computer stores data and programs while it is running.

There are two main types of computer memory: Primary and secondary memory.

**7: Hardware**: The physical parts of the computer system that you can touch and feel are known as computer hardware. For Example: Keyboard, Mouse, Monitor etc.

**Software**: A set of instructions given to computer to perform a particular task is called software. For example: MS Word. A computer is useless without software and vice versa.

**8:The Universal Product Code (UPC)** is a unique 12-digit code assigned to each trade item (product) to identify it and its manufacturer. It is a standard bar code symbology widely used worldwide for tracking trade items in stores.

**9: MICR, or Magnetic Ink Character Recognition**, is a technology used to read and process data printed with a special magnetic ink. This technology is primarily used in the banking industry for processing checks and other financial documents.

**10: Why ram is called non volatile memory?** RAM actually stands for Random Access Memory and is considered volatile memory. This means that it loses its data when the power is turned off.

**11: RAM: Random Access Memory** – it is also called main memory, program's instruction and data are stored temporarily in RAM.

**ROM: Read Only Memory** – It is permanent memory and contains the instructions required in booting process.

**12: CPU registers**, also known as processor registers, are small, high-speed memory locations built directly into the CPU. They act as temporary storage spaces for data and instructions that the CPU is currently working on.

**13: Magnetic-strips cards**: A magnetic-strip card has a strip of magnetically encode data on its back. They are used for personal identification during driving, in the stores, at public places etc.
