① Discuss different Types of Variables in Visual Basic.

Variables:—

In Visual Basic (VB), Variables are used to store data that a program can manipulate. Variables can hold different types of values, such as numbers, text, dates, etc. The type of variable you use determines the kind of data it can hold.

Types of variables

There are the main types of variables in Visual Basic.

1. Integer—

Stores whole number (without decimals).

e.g.—

Vb

Dim age As Integer = 25

DATE: _____

DAY: _____

2. Floating-point number —

Stores numbers with a decimal like
e.g

Vb

Dim temperature as Double
= 36.5

3. Boolean —

Stores True or False values.

e.g

Vb

Dim ispassed As Boolean =
True.

4. Data —

Store data and time values.

e.g

Vb

Dim dob As Data = #12/12/2000#

5. Object —

Can store any data type (least specific, more flexible)

e.g

DATE: _____

DAY: _____

Vb

Dim data As object = "Hello"

② How do you display a message box in Visual Basic?

In Visual basic, you can display a message box using the built-in MsgBox function or the net method MessageBox.Show.

Using MsgBox (VB6/VB.NET) -

Vb

MsgBox("Hello, this is a message!")

This displays a simple popup with an ok button.

Using MessageBox.Show (VB.NET) -

Vb

MessageBox.Show("Do you want to continue?", "Confirmation", MessageBoxButtons.YesNo, MessageBoxIcon.Question)

DATE: _____

DAY: _____

This version allow you to set the title, buttons (Yes/No, OK/Cancel), and icons (info, warning, etc).

e.g

Vb

```
Dim result As DialogResult  
Result =
```

```
MessageBox.Show("Are you  
Sure you want to exit?",  
"Exit confirmation",  
MessageBoxButtons.YesNo).
```

```
If result = DialogResult.Yes  
Then
```

```
Application.Exit() End
```

```
If.
```

③ How do you write an event handler in Visual Basic?

In Visual Basic (VB.NET), an event handler is a procedure that runs in response

DATE: _____

DAY: _____

to a specific event, like clicking a button or loading a form.

Basic Syntax for an Event Handler —

Vb

```
Private Sub
```

```
Button1_Click (Sender As  
Object, e As EventArgs)
```

```
Handles Button1.Click  
    MessageBox.Show("Button  
    was clicked!")
```

```
End Sub.
```

Explanation —

- private sub Declares a private procedure.

- Button1-Click Name of the procedure (you can name it anything).

- Handles Button1.Click specifies the event it handles (in this case, the click event of Button1).

DAY: _____

④ Write a VB program to find the largest among three numbers.

Visual Basic (VB.NET) program that finds the largest among three numbers entered by the user.

VB.NET program:

Find the Largest of Three Numbers

vb
Module Module1
Sub Main()

Dim num1, num2, num3

As Integer.

Console.WriteLine("Enter first number: ")

num1 = Convert.ToInt32(Console.ReadLine())

Console.WriteLine("Enter second number: ")

DATE: _____

DAY: _____

```
num2 = Convert.ToInt32(Console.ReadLine())  
Console.WriteLine("Enter third  
number :")
```

```
num3 = Convert.ToInt32(Console.ReadLine())
```

```
If num1 >= num2 and  
num1 >= num3 Then
```

```
Console.WriteLine("The largest  
number is : " & num1)
```

```
ElseIf num2 >= num1  
And num2 >= num3 Then
```

```
Console.WriteLine("The largest  
number is : and num2)
```

```
Else
```

```
Console.WriteLine("The largest  
number is: " and num3)
```

```
End If
```

```
Console.ReadLine()
```

wait for user input before
closing

```
End Sub
```

End Module.

⑤ What are the main components of a Visual Basic program?

Main components of a Visual Basic (VB) program:

- **Namespace —**

It's like a folder that helps organize your code.

- **Module or class —**

This is where your code lives. A module is used for basic programs, and a class is used in bigger or GUI based programs.

- **Variables —**

Used to store values like number or text.

- **Control Statement —**

Used to make decisions or repeat things.

- **Forms —**

DATE: _____

DAY: _____

In apps with a window (GUI), a form is the screen you see with buttons, text boxes, etc.

⑥ write a VB program to check whether a given number is prime or not.

Visual Basic program to check if a number is prime or not.

Prime Number :-

A prime number is a number that has only two factors - 1 and itself. e.g.:- 2, 3, 5, 7, 11 are prime numbers.

VB program

Vb

Module Module1

Sub Main()

Dim num As Integer

Dim i As Integer

Dim isprime As

DATE: _____

DAY: _____

Boolean = True

Console.WriteLine("Enter
a number: ")

num =

Console.ReadLine()

If num <= 1 Then

is prime = False

Else

For i = 2 To num

-1

If num mod i

= 0 Then

is prime = False

Exit For

End If

Next

~~End If~~

Return True

End Function

End Module.
