

Research Methodology

2015

Short Question:-

- a) Differentiate between bibliography and references.

Bibliography

* A bibliography is the listing of the work that is relevant to the main topic of research interest arranged in alphabetical order of the last names of authors.

* Bibliography is created on the basis of primary and secondary sources.

References

A reference list is the subset of the bibliography, which includes details of all the citations used in the literature survey and elsewhere in the paper, arranged again in the alphabetical order of the last names of the authors.

References are based on primary sources.

Date: _____

- | | |
|--|---|
| * It includes both in-text citations and other sources, that are used to generate the idea | It includes only in-text citation, that have been used in the assignment or project |
| * A bibliography cannot be used to support an argument | A reference can be used to support an argument. |
| * It is used for Journal papers and Research work. | It is used for Thesis and dissertation |

b-) Sampling frame and its affects on survey-

A sampling frame is a list of all the items in your population. It's a complete list of everyone or everything you want to study. (The difference between a population and a sampling frame is that the population is general and the frame is specific.) The list of population members or elements is required to draw sample. It is called

Date: _____

Sampling frame-

Book Pg 144

c-) Write a note on cluster sampling?

In cluster sampling, Researchers divide a population into internally heterogeneous subgroups. Some are randomly selected for further study.

Cluster sampling is a method of probability sampling that is often used to study large populations, particularly those that are widely geographically dispersed.

Advantage:-

- ⇒ Provide an unbiased estimate of population parameters if properly done.
- ⇒ Economically more efficient than simple random.
- ⇒ Lowest cost per sample, especially with geographic clusters.
- ⇒ Easy to do without a population list.

Disadvantage:-

- ⇒ Often lower statistical efficiency (more error) due to subgroups being homogeneous rather than ~~test~~ heterogeneous.

d.) Define Pre-testing of a questionnaire - What are the advantages?

Pretesting is the stage in the development of a questionnaire that determines the potential effectiveness of the questionnaire - The pretest is conducted prior to the final distribution of the questionnaire to the target population.

Advantages of Pre-testing questionnaire:-

- ⇒ Pretesting will help us to determine if respondents understand the questions as well as if they can perform the tasks or have the

Date: _____

information that question require-

~~Pretests also provide the most direct evidence for the validity of the~~

⇒ It may help the researcher to drop or add the necessary questions before going to the main data collection work-

⇒ It is preliminary feasibility research process that will help the researcher to make his research more soulful-

⇒ It will help to adjust the research question and research design and to prevent unnecessary cost and time expenditures in the main data collection-

2- Explain the term "Survey"
and its various types-

Book Pg 123-125

3- What are the qualities of "good data"? Explain its types- ~~and~~ to collect data- and sources

Ans The qualities of good data are as follows:

1- Accuracy :-

It is necessity for data to remain error-free and precise, which means it should be free of erroneous information, redundancy and typing errors-

2- Consistency :-

The element of consistency removes room for contradictory data-

3- Completeness :-

The data should be complete without any missing data-

4- Validity :-

Validity indicates that all data is aligned with the existing formatting rules-

5- Uniqueness:-

There will be no overlapping of data and it will be recorded only once. The same data may be used in multiple ways, but it will remain unique.

6- Timeliness :-

Timeliness means that data has been updated to keep it current and is available to use when it's needed.

types and sources of data to collect

Types:-

- 1- Primary Data (Book pg 99 to 101)
- 2- Secondary Data

Sources:-

- 1- Internal sources (Book Pg 101 to 102)
- 2- External sources

Date: _____

3- How sample size is determined under different conditions.

For sample size following principle must be kept in mind:

- If the dispersion or variance with in the population is greater then large sample is required for precision.
- The greater, ~~the~~ desired precision, larger the sample must be.
- If interval range is narrow, sample size must be large.
- Large number of sub-groups in stratified sampling, a large number of samples are required.
